In using the cross references, the general nature of many of them should be kept in mind thus, the reference "Benzene, ethoxy See Phenetole" is applicable not only to this compound itself but to derivatives, which are indexed under it rather than under Benzene

## ORGANIC RADICALS

An extensive list of preferred names for organic radicals was given in the 1927 Index in a place corresponding to this and also in the Introduction of the Second Decennial Subject Index. With few exceptions they are the ones in common use. Attention is here called merely to the preferred names for some radicals having more than one name in the literature and to some radical names recently adopted.

## RING INDEX

The following index of ring complexes is arranged as shown by the bold face figures 1 Ring Systems, with single figures indicating simple rings of 3 5 etc. members 2-Ring Systems two figures denoting double rings of 3 and 4 3 and 5 etc. members, then the triple and still more complex forms Under each combination of figures the kind and number of atoms in the ring or rings are expressed in formulas These formulas are arranged so that their initial rings are in the same order as in the Formula Index (see Key at the beginning of it) If the initial rings are alike the second rings of the formula are considered and so on. By this means the reader will be able to learn the name used in the index for the simplest parent compound containing any particular ring or combination of rings and by turning to this name in the index he will find the compound listed and perhaps cross references to names of derivatives Rings which are united but which have no atoms in common (e g biphenyl) and 'spiro compounds' which are characterized by two rings having but one atom in common are not regarded as ring complexes nor included in this index

To illustrate 6,6,6  $C_4N_7C_4C_4$  Benzocinnoline

Perimidine

Phenazine

(1) This designates a complex ring of three components each of six members, (2) the first is heterocyclic, containing four carbon atoms and two nitrogen atoms and the other two are carbocyclic rings of six atoms each, (3) parent compounds of this configuration will be found in the index under the three names given If derivatives are indexed a structural formula will be found with the proper numbering and also appropriate cross references to derivatives having other common names if any such are in the index

It should be noted that the classification is made with reference to the smallest rings which, placed together, will constitute the plane formula Thus hexamethylene-tetramine is treated as a 6 6 6 complex although a fourth six membered ring (composed of atoms from the three six membered rings) is also present
